Hyperhidrosis [Excessive Sweating]

Information for Patients

What does the treatment involve?

Small volumes of Botulinum toxin (Botox) is injected in to the area where excessive sweating occurs to prevent the nerves from stimulating production of sweat from the sweat glands.

The procedure is temporary and the first course of treatment usually lasts approximately 9 months. After this time the treatment may require repetition to maintain ongoing results.

Thousands of individuals who have received the treatments are living life with more confidence and freedom.

The treatment consists of 1 session. [£499.00]

If you have any questions or wish to discuss any procedure, do not hesitate to contact us.
